SECTION A: MONTHLY LABOUR FORCE SURVEY

Part-time Employment

The proportion of employed persons who are part-time workers has generally increased over the period 1978-79 from an average 15 per cent to 24 per cent in 1994-95, with some stalling of growth in 1993-94. Part-time workers are defined as employed persons who usually worked 35 hours per week and did so during the survey reference week.

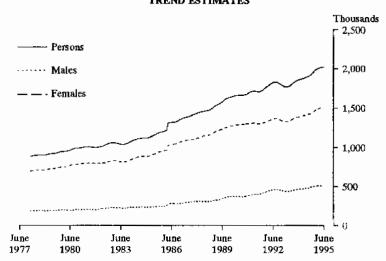

Trend series

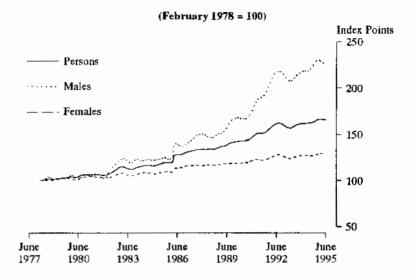

Part-time employment now exceeds 2 million persons. The trend estimate of part-time employment for June 1995 was 2,023,000, an increase of 130,000 persons (6.8 per cent) in the last twelve months.

PART-TIME EMPLOYMENT TREND ESTIMATES

In recent years trend part-time employment increased generally to a peak of 1,833,000 in August 1992, followed by a decline to 1,767,000 in April 1993. The trend has been rising steadily since then.

PART-TIME EMPLOYMENT INDEX

In contrast, trend full-time employment peaked in June 1990, followed by a decline to 5,808,000 in October 1992. The trend has been increasing since then, and now stands at 6,233,000 - slightly above the 1990 peak.

More female part-time workers

Women continue to outnumber men among part-time workers, by some three to one. In June 1995, women represented 75 per cent of all part-time workers. This ratio has gradually declined as the number of male part-time workers has increased at a faster rate. The ratio was 3.7 to 1 in June 1978, with the fall in the ratio occurring most markedly since mid-1988.

The trend-index graph illustrates the rate of growth in male part-time employment, showing a number of periods of strong growth since mid-1988. For women working part-time, the rate of growth was less pronounced. However, in the last twelve months, male and female part-time trend estimates each increased by 6.8 per cent.

Male part-time employment as a proportion of total male employment has been increasing markedly in recent years. The ratio has increased from 4.9 per cent of total male employment in June 1978 to 7 per cent in mid 1988, but since then has shown a more rapid rate of increase to 10.8 per cent in June 1995. For females, the ratio of part-time to total employment has also increased, but at a lesser rate than for males, following strong gains in female full-time employment. The ratio now stands at 42 per cent in June 1995, having risen from 33 per cent in June 1978.

Age distribution

The age distribution of male part-time employment in June 1995 shows that those aged 15 to 24 held 44 per cent of all male part-time employment. Females in this age group had 24 per cent of female part-time employment. For males the share of part-time employment held decreases with age. For females those aged 35 to 44 have the greatest share (28 per cent) of female part-time employment.

	PART-TIN		RS BY SEX E 1995	AND AGE,		
		(per	cent)			
	15-24	25-34	35-44	45-54	55-64	65+
Males	43.7	15.1	12.7	10.4	11.2	6.9
Females	23.5	21.3	27.7	19.3	6.8	1.3
Persons	28.5	19.8	23.9	17.1	7.9	2.7

In June 1995, part-time workers aged 15 to 19 were predominantly (78 per cent) full-time students at school or at a tertiary educational institution. Of persons aged 20 to 24 who were employed part-time, 38 per cent were full-time tertiary students.

General characteristics

Some 26 per cent of all part-time workers in June 1995 reported a preference to work more hours. The ratio has declined as the job market has recovered. In May 1993, when full-time employment began to improve, the ratio was 29 per cent.

Not all part-timers who want to work more hours are engaged in active search for full-time work. The proportion was 39.9 per cent in June 1995, compared with 38.8 per cent in May 1993, when opportunities for full-time work were more limited.

Other details of part-time workers in June 1995:

- 35 per cent worked for 10 hours or less in the reference week unchanged for June in the past five years;
- 26 per cent of employed persons born in Australia were employed part-time, compared with 22 per cent for employed persons born outside Australia; and
- average hours worked for male and female part-time workers were virtually the same - 15,2 and 15,3 hours respectively.

Further Information

The ABS has a wide range of unpublished data relating to part-time workers. These data are available on microfiche, floppy disk and customised reports. The ABS generally makes a charge for providing unpublished statistical information. Address inquiries to Sylvia Sajler in Canberra (06) 252 6525 or contact any ABS office.

The Labour Market in Brief: June 1995

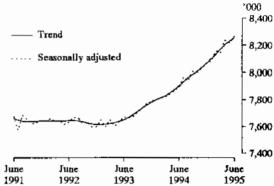

Trend estimates

In June 1995, the provisional trend estimate of employment rose to 8,255,500, 4.5 per cent higher than in June 1994. The trend estimate of unemployment fell to 751,400 persons, 21 per cent lower than the peak of 947,200 recorded in September 1993. The trend estimate of the unemployment rate remained at 8.7 per cent for males, compared with 10.0 per cent recorded in June 1994, while for females the rate fell to 7.8 per cent, compared with 9.5% recorded in June 1994. The trend estimate of the participation rate actually rose by less than 0.1 points, but due to rounding stands at 63.8 per cent. The male and female rates stood at 73.9 per cent and 54.0 per cent respectively.

Employment

In June 1995, the seasonally adjusted estimate of employment grew by 51,700 to 8,268,100, with part-time employment rising by 30,200 to 2,034,500. For females, part-time employment rose by 32,800 to 1,527,600 while the number of females employed full-time increased to 2,058,200. For males, seasonally adjusted employment rose slightly to 4,682,300.

EMPLOYED PERSONS

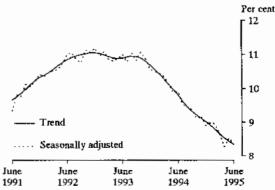

Unemployment

The seasonally adjusted estimate of unemployment for June 1995 fell slightly to 451,300 for males, and for females unemployment fell by 9,700 to 298,900. In seasonally adjusted terms, the number of unemployed males and females seeking full-time work fell to 400,400 and 209,100 respectively. The number of males looking for part-time work fell to 51,000 while the number of females seeking part-time work fell to 89,800.

Unemployment rate

The June 1995 seasonally adjusted unemployment rate fell by 0.2 percentage points to 8.3 per cent. The rate for males fell by 0.1 points to 8.8 per cent while for females, the rate fell by 0.3 points to 7.7 per cent.

UNEMPLOYMENT RATE

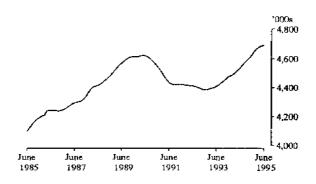

Participation Rate

The seasonally adjusted estimate of the labour force participation rate rose by 0.2 percentage points but due to rounding stood at 63.8 per cent in June 1995. For males, the participation rate fell by 0.1 points to 73.8 per cent, while the female rate actually rose by 0.4 points but due to rounding stood at 54.2 per cent, the highest rate recorded by the survey.

EMPLOYED PERSONS: TREND SERIES

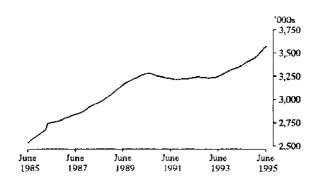

Employed males

After reaching a peak of 4,620,800 in May 1990, male employment fell to a low point of 4,385,000 in January 1993. Since then, the trend has been increasing and in June 1995 stood at 4,689,000, 15 per cent higher than 10 years ago.

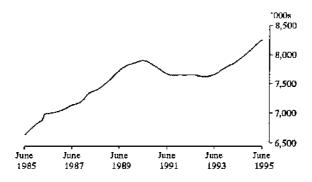

Employed females

Apart from a gradual fall between July 1990 and October 1991, the trend in female employment has been generally increasing. In June 1995, the trend estimate was 3,566,600, 41 per cent higher than 10 years ago.

Employed persons

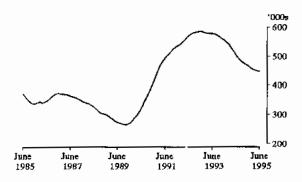

The number of persons employed in Australia rose to 7,894,700 in June 1990 before falling to 7,615,400 in January 1993. Since then, the trend in employment has been increasing and in June 1995 stood at 8,255,500, 4.6 per cent higher than the 1990 peak.

UNEMPLOYED PERSONS: TREND SERIES

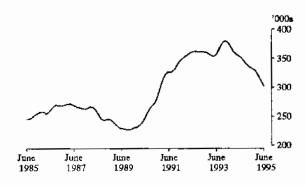

Unemployed males

From a low of 264,800 in October 1989, trend estimates of the number of unemployed males reached a peak of 585,100 in December 1992. The trend has been falling since then, although the rate of decline has slowed in recent months, and in June 1995 the trend estimate stood at 448,700.

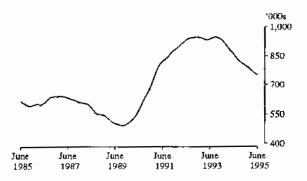

Unemployed females

From a low-point of 226,800 in September and October 1989, trend estimates of unemployed females reached a peak of 379,200 in October 1993. Since then, the trend has been falling and in June 1995 stood at 302,700, the lowest level since January 1991.

Unemployed persons

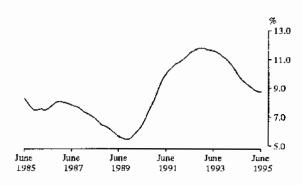

Since the trough of 491,500 in October 1989, trend estimates of unemployment rose to a high point of 947,200 in September 1993. The trend has been falling since then and in June 1995 stood at 751,400, the lowest level recorded since February 1991.

UNEMPLOYMENT RATE: TREND SERIES

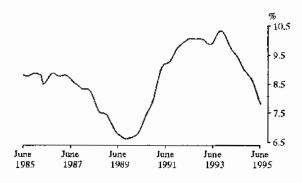

Males

Following the low-point of 5.4 per cent in October and November 1989, the trend unemployment rate for males reached a peak of 11.8 per cent between November 1992 and January 1993. The trend rate has been falling since then, and in June 1995 stood at 8.7 per cent, unchanged from May 1995.

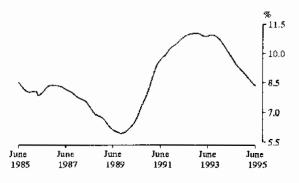

Females

From a low-point of 6.6 per cent from September to December 1989, the trend unemployment rate for females reached a peak of 10.3 per cent between September and November 1993. The trend rate has been falling since then, and in June 1995 stood at 7.8 per cent, 2.5 percentage points lower than the peak recorded almost two years ago.

Persons

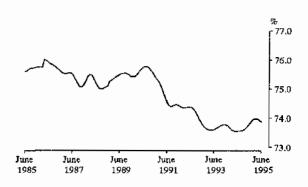

After reaching a low-point of 5.9 per cent from September to November 1989, the trend unemployment rate rose to a peak of 11.1 per cent in December 1992. Since then, the trend has been falling and in June 1995 stood at 8.3 per cent, the lowest level in four and a half years.

PARTICIPATION RATE: TREND SERIES

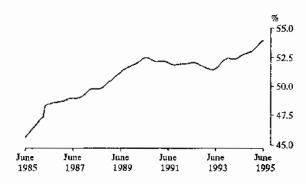

Males

From 75.8 per cent recorded in July and August 1990, the trend participation rate for males fell to 73.6 per cent in February 1993. After a short period of growth it declined again to 73.5% in May and June 1994. The trend rate then rose to 74.0 per cent and in June 1995 stood at 73.9 per cent.

Females

The trend female participation rate rose to 52.5 per cent in mid 1990, before falling slightly to 51.4 per cent in April and May 1993. The trend has been rising since mid 1993 and in June 1995 was 54.0 per cent.

Persons

The trend participation rate reached a peak of 64.0 per cent in July and August 1990, and then fell to 62.3 per cent in April and May 1993. Apart from falls at the beginning of 1994, the trend participation rate has been rising and in June 1995 stood at 63.8 per cent.

⁽a) See Explanatory Notes paragraphs 43 and 44 for details of exclusions to family tables. (b) "Family type" is a new classification. See Explanatory Notes 45 and 47 and the Glossary for definitions of the categories. (c) Includes a small number of families with husband not in the labour force and wife unemployed.

EXPLANATORY NOTES

Introduction

This publication contains estimates of the civilian labour force derived from the Labour Force Survey component of the Monthly Population Survey. Estimates of the labour force characteristics of family members and of family composition are also included.

- 2. Estimates of the civilian labour force are available for over sixty regions across Australia and are shown in various publications produced by State offices of the ABS. These data are also available on microfiche or as a special data service. For details, contact any ABS office.
- 3. Preliminary survey results are published in advance of this more detailed publication in *The Labour Force, Australia, Preliminary* (6202.0).
- 4. Although emphasis in the population survey is placed on the regular collection of specific data on demographic and labour force characteristics of the population, supplementary and special surveys of particular aspects of the labour force or of other subjects are carried out from time to time. Statistics from these surveys are available on request. Summary statistics from these surveys are published in *The Labour Force*, Australia (6203.0), from time to time.
- 5. The population survey is based on a multi-stage area sample of private dwellings (currently about 30,000 houses, flats, etc.) and a list sample of non-private dwellings (hotels, motels, etc.), and covers about one-half of one per cent of the population of Australia. The information is obtained from the occupants of selected dwellings by specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the reference week).
- 5. The Labour Force Survey includes all persons aged 15 and over except;
 - (a) members of the permanent defence forces;
 - (b) certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
 - (c) overseas residents in Australia; and
 - (d) members of non-Australian defence forces (and their dependants) stationed in Australia.

From July 1993 Jervis Bay Territory is also excluded from the scope of the survey. Before July 1993 it was included in estimates for the Australian Capital Territory.

- 7. In the Labour Force Survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. The chance of a person being enumerated at two separate dwellings in the one survey is considered to be negligible. See paragraph 43 for information about the effect of the coverage rules on family statistics.
- 8. Persons who are away from their usual residence for six weeks or less at the time of interview are enumerated at their usual residence (relevant information may be obtained from other usual residents present at the time of the survey).
- 9. Labour Force Survey estimates of persons employed, unemployed and not in the labour force are calculated in such a way as to add up to the independently estimated distribution of the usually resident population aged 15 and over by age and sex. This procedure compensates for under-enumeration in the survey, and leads to more reliable estimates. Persons who, at the time of interview, are overseas for more than six weeks but for less than twelve months

Comparability of series

are included in the independent population statistics (benchmarks) and are thus provided for in the calculation of the estimates. The benchmarks are the latest available estimates at the time the Labour Force Survey is conducted, but they usually differ from the official population estimates subsequently published in *Australian Demographic Statistics* (3101.0) because they are derived from incomplete information about population changes.

- 10. Survey estimates are not revised for the usually small amendments of population benchmarks arising from new data on deaths and overseas and internal migration. Revisions are made, however, after each Census of Population and Housing, and when population estimation bases are reviewed. These revisions affect original, seasonally adjusted and trend estimates. The last such revision was made in February 1994 to take account of the results of the 1991 Census of Population and Housing, which affected all the monthly estimates from January 1989 to January 1994.
- 11. Population benchmarks used in the estimation of Labour Force Survey data are compiled according to place of usual residence. For an explanation of the conceptual basis of population estimates, see *Information Paper: Population Estimates: An Outline of The New Conceptual Basis of ABS Population Estimates* (3216.0). Prior to October 1982, labour force estimates were based on a combination of place of enumeration and place of usual residence.
- 12. National surveys were conducted in February, May, August and November each year from 1964 to February 1978. The survey has been conducted on a monthly basis since February 1978.
- 13. The questionnaire used in the survey for the collection of labour force data has been revised from time to time, the latest occasion being for the April 1986 survey. Details of these changes have been published in *Information Paper:* Questionnaires Used in the Labour Force Survey (6232.0) in March 1978, December 1981, August 1984, June 1986, June 1991 and March 1993.
- 14. In April 1986, the questionnaire was revised following the extension of the definition of employed persons to include persons who worked without pay between 1 and 14 hours per week in a family business or on a farm (i.e. contributing family workers). This definition aligned the Australian labour force concepts with the set of definitions adopted by the 13th International Conference of Labour Statisticians in October 1982.
- 15. Previously, contributing family workers who worked 1 to 14 hours, or who had such a job but were not at work, were defined as either unemployed or not in the labour force, depending on whether they were actively looking for work. In order to assist users to assess the impact of the change, estimates for March 1986 based on the new definition were shown in footnotes to Tables 1 and 2 of the February, March and April 1987 issues of this publication.
- 16. A revised procedure for weighting families estimates, as presented in this publication, was also introduced in April 1986. Additional tables were included in the April 1986 issue of this publication to show the impact of this new procedure. Paragraph 48 contains more details.
- 17. As noted in paragraph 10, estimates from January 1989 were revised to conform to revised population estimates following the 1991 Census of Population and Housing, and are thus not strictly comparable with estimates for periods prior to January 1989. An examination of the revised estimates showed that the effects on Labour Force Survey estimates for the period before January 1989 were inconsequential, and that no meaningful purpose would be served by publishing revised estimates for that period.
- 18. Comparability with estimates produced from the quarterly Survey of Employment and Earnings is affected by the use of a different survey methodology and definitions. The Labour Force Survey provides estimates of people in

jobs whereas the Survey of Employment and Earnings provides an estimate of the number of jobs held by wage and salary earners. A more detailed description of the differences between these two series is provided in *Information Paper: Comparison of Employment Estimates from the Labour Force Survey and the Survey of Employment and Earnings* (6263,0).

- 19. From December 1989 onwards, the category "other families" was split into "one-parent families" and "other families". Therefore estimates of other families were not strictly comparable with estimates in previous issues. However, in November 1989, 97 per cent of other families with dependants were one-parent families. In March 1994, a new families classification was introduced which also affected comparability (see paragraphs 45 to 47).
- 20. Following each Population Census, the ABS redesigns and reselects the Labour Force Survey to take into account the new information which is obtained from the Census. The sample used in the Labour Force Survey from September 1987 to August 1992, which was designed and selected using preliminary data from the 1986 Census, was updated and reselected using information collected in the 1991 Census. The new sample was phased in over the period September 1992 to December 1992. For additional information, see *Information Paper:* Labour Force Survey Sample Design (6269.0), available from any ABS office.
- 21. The sampling fractions for each State/Territory differ and are such that the resultant sample yields reliable estimates of the main labour force aggregates for each State and Territory. The sampling fractions for the new sample together with the sampling fractions determined from the 1986 Census are:

	1986 Census redesign	1991 Census redesign
New South Wales	1 in 230	1 in 277
Victoria	1 in 230	1 in 242
Queensland	1 in 160	1 in 195
South Australia	1 in 115	1 in 139
Western Australia	1 in 115	1 in 146
Tasmania	1 in 70	1 in 75
Northern Territory	1 in 115	1 in 75
Australian Capital Territory	1 in 115	1 in 75

Reliability of the estimates

Survey sample redesign

- 22. Estimates in this publication are subject to two sources of error:
 - (a) sampling error: since the estimates are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them, may differ from the figures that would have been produced if all dwellings had been included in the survey. More information on this topic is given in the Technical Notes; and
 - (b) non-sampling error: inaccuracies may occur because of imperfections in reporting by respondents and interviewers and errors made in coding and processing data. These inaccuracies may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

Differences between Census and Labour Force Survey estimates

- 23. The results of the 1991 Census of Population and Housing show that labour force estimates derived from the census differ from those derived from the Labour Force Survey.
- 24. The broad concepts underlying the measures of the labour force and its components, employment and unemployment, are similar in the census and the

survey. It should be noted, however, that census estimates of unemployment do not take into account the 'available for work' criterion.

- 25. There are considerable differences in both the collection methodology adopted (including the detailed questions asked) and estimation procedures. Factors contributing to differences in estimates include under-enumeration in the population census for which census labour force estimates have not been adjusted, the use in the Labour Force Survey of population benchmarks derived from incomplete information about population change (see paragraph 9), the inclusion of permanent defence forces in census estimates, the personal interview approach adopted in the survey as opposed to self-enumeration of census schedules, differing questions used to determine labour force characteristics (particularly the identification of unemployed persons) and differing methods of adjustment for non-response to the survey or census.
- 26. The Labour Force Survey provides detailed and up-to-date estimates of employment and unemployment for Australia, States and regions, whereas the Census of Population and Housing provides counts for small areas but in less detail than is available from the survey.
- 27. These considerations should be borne in mind when comparisons are made between population census and Labour Force Survey estimates.
- 28. Seasonally adjusted series are published in Tables 2, 8 and 40. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series can be recognised more clearly. Seasonal adjustment does not remove the irregular or non-seasonal influences which may be present in any particular month. This means that month-to-month movements of the seasonally adjusted estimates may not be reliable indicators of trend behaviour. For example, irregular factors unrelated to the trend account for more than half the seasonally adjusted movement in series at the Australia level, with the following frequency:

Employment: 5 in 10 monthly movements
Unemployment: 7 in 10 monthly movements
Unemployment rate: 7 in 10 monthly movements
Participation rate: 9 in 10 monthly movements

- 29. The seasonal factors for all seasonally adjusted series are reviewed annually to take account of each additional year's original data. The latest review, in February 1995, revised the Australian and State seasonally adjusted and trend monthly series back to February 1978. Information about the method of adjustment and revised seasonally adjusted and trend estimates for all months since January 1990 for Australia and the States were published in an Appendix to the February 1995 issue of this publication.
- 30. Smoothing seasonally adjusted series produces a measure of trend by reducing the impact of the irregular component of the series. The monthly trend estimates are derived by applying a 13-term Henderson-weighted moving average to all months except the last six. The last six monthly trend estimates are obtained by applying surrogates of the Henderson average to the seasonally adjusted series. Quarterly trend estimates (eg employment by industry) are derived by applying a 7-term Henderson moving average to the seasonally adjusted series. The 7-term Henderson average also uses surrogate forms of the average as the end of a time series is approached. Unlike the surrogate weights of the 13-term Henderson used on monthly data, the weights employed here are tailored to suit the particular characteristics of individual series. These trend series are used to analyse the underlying behaviour of the series over time. Tables 3 and 9 show trend estimates for the past 15 months. Trend series graphs are shown on pages 6 to 9. Data from February 1978 are available on the ABS

Seasonal adjustment

Trend estimation

on-line data dissemination service, PC-AUSSTATS. The trend series of the participation rate for married females are based on smoothed population estimates.

- 31. While this smoothing technique enables estimates to be produced which include the latest month, it does result in revisions to the most recent months as additional observations become available. Generally, subsequent revisions become smaller, and after three months or two quarters have a negligible impact on the series. There will also be revisions as a result of the annual review of seasonal factors mentioned above in paragraph 29.
- 32. Trend estimates for the Australian Capital Territory and the Northern Territory are published in Table 9. Original estimates for the two Territories have shown, historically, a high degree of variability, which can lead to considerable revisions to the seasonally adjusted estimates after each annual seasonal factor re-analysis. Seasonally adjusted estimates are not currently published for the two Territories. The most recent six months trend estimates are subject to revision. For the three most recent months, the revision may be relatively large. Inferences about trends drawn from smoothed seasonally adjusted (trend) estimates for months earlier than the latest three months are unlikely to be affected by month-to-month revisions. They may, however, be revised as a result of the annual re-analysis of seasonal factors.
- 33. Users may wish to refer to the ABS publication A Guide to Interpreting Time Series Monitoring "Trends", an Overview (1348.0) for further information about trend estimates. Details of the trend weighting patterns are available on request from the Assistant Director, Time Series Analysis on (06) 252 6345.
- 34. Care should be taken in the interpretation of month-to-month movements in these estimates. Survey estimates are subject to sampling and non-sampling variability as explained in paragraph 22.
- 35. In order to minimise respondent load and at the same time maintain continuity within the population survey sample, one-eighth of the dwellings are replaced after each survey. Adoption of this rotation procedure, whereby about seven-eighths of the sample remains unchanged from one month to the next, enables more reliable measurements of changes in the labour force characteristics of the population to be made than would be possible if a new sample were introduced each month.
- 36. Because a high proportion of private dwellings selected in one survey remains in the sample for the following survey, it is possible to match the characteristics of most of the persons in those dwellings from one month to the next, to record any changes that occur, and hence to produce estimates of flows between the different categories of the population and labour force.
- 37. The procedures used to select persons in non-private dwellings preclude the possibility of matching any of them who may be included in successive surveys. For this and other reasons, including the mobility of the population and non-response in either or both surveys, about 10 per cent of persons in those dwellings which are included in the sample in successive months cannot be matched. Those who can be matched represent about 80 per cent of all persons in the survey.
- 38. Changes in the characteristics of this latter group are shown in the gross flows table (Table 34). About one half of the remaining (unmatched) 20 per cent of persons in the survey are likely to have characteristics similar to those in the matched group, but the characteristics of the other half are likely to be somewhat different.
- 39. Gross flow estimates relate only to those persons in private dwellings for whom information was obtained in successive surveys. The expansion factors used in calculating the estimates were those applying to the second of each pair of months. Note that the estimates have not been adjusted to account for the

Month-to-month movements

Gross flows

unmatched sample component.

- 40. Although it is not possible to provide gross flow estimates for all persons in the survey it is considered that the estimates derived from matched records will be a useful guide to the proportions of the movements between categories which underlie the changes in monthly levels. When comparing flows for different periods it is important to take into account the population represented by the matched sample, as shown in the last line of the table.
- 41. While every effort is made to reduce non-sampling errors to a minimum any such errors affecting labour force status will tend to accumulate in the gross flow statistics rather than to cancel out. The estimates are also subject to sampling variability, as explained in the Technical Notes. For these reasons the estimates of flows should be used with caution. The standard errors may be obtained from Table A of the Technical Notes.

Labour force status and other characteristics of families

- 42. As a part of survey procedures, family relationships are determined each month, enabling both the estimation of persons cross-classified by their relationship in the household and the estimation of families. This publication contains tables showing the labour force status and family status of individuals and families classified by family type, number of family members, the labour force status of persons within families, the number of children under 15 present and the number of dependants present.
- 43. Because of the coverage rules, persons who usually live with other members of their family may, at the time of the survey, be enumerated as not living with all the usual members of their family. This situation is more likely for persons who are enumerated as visitors to other private dwellings or as persons staying in non-private dwellings (hotels, hospitals, etc.). The determination of family structure and family characteristics in such cases is difficult. Thus for survey questions used to determine family relationships, scope was further restricted to usual residents of private dwellings and the following persons were excluded:
 - (a) all persons enumerated in non-private dwellings (including hotels, motels, hospitals and other institutions); and
 - (b) persons enumerated as visitors to (rather than usual residents of) private dwellings.
- 44. In addition, in those households where it was not possible to obtain information relating to all the usual residents, no family information was recorded. Thus persons living in households which include a member of the permanent defence forces, who is outside the scope of the population survey, are excluded from survey questions used to determine family relationships because family information could not be obtained from each usual resident. Similarly households which, at the time of the survey, have one or more of their usual residents away for more than six weeks, are excluded from the family survey. This also applies to households from which an incomplete or inadequate questionnaire was obtained for any usual resident in on scope and coverage. A summary of those persons for whom family information is obtained as well as those usual residents of private dwellings for whom complete family information cannot be obtained, and those persons specifically excluded from the family determination procedures is contained in the family tables. Generally, relationship in household is determined for more than 90 per cent of all civilians aged 15 and over.

Changes in families classifications

- 45. Relationship in household and Family type classifications were introduced in the March 1994 issue of this publication to align with ABS standards. Most categories in the two classifications remain comparable with categories in the previous classifications. The cases in which there are breaks in comparability are discussed in the following paragraphs.
- 46. Relationship in household. This classification was previously referred to as

Family status.

- (a) Lone parents (previously referred to as Sole parents) now includes parents with non-dependent children (provided those children are without a spouse or children of their own). These Lone parents without dependants are shown separately in Table 35 and there were 205,800 such persons in March 1994.
- (b) Dependent students (previously Full-time students aged 15-24) now comprise sons or daughters (of a couple or a lone parent) aged 15 to 19 attending school or aged 15 to 24 attending a tertiary educational institution full time. Other related full-time students, who were also previously classified as Full-time students aged 15-24 are now included in Other family persons. There were 24,200 such persons in March 1994.
- (c) Other family persons now comprises the previous groups Other family head, excluding those now counted as Lone parents (79,200 persons in March 1994), the other related full-time students previously classified as Full-time students aged 15-24 (see above; 24,200 in March 1994) and Other relative of married couple or family head (218,100 in March 1994).
- 47. Family type. This classification was previously referred to as Type of family. There are three types of families in the new classification, as follows:
 - (a) Couple families is the term used to describe families previously referred to as Married-couple families. The new category is otherwise exactly comparable with the old category.
 - (b) One parent families now includes those families in which there is a lone parent with only non-dependent children present. Such families were previously included in Other families. There were 208,400 of these families in March 1994.
 - (c) Other families now excludes those families in which there is a lone parent with only non-dependent children present (see above).
- 48. Estimates of the number of families in this publication differ from those in publications prior to the April 1986 issue. This is due to the adoption of a weighting procedure where the weight for a family is determined using an average of the weights for all family members responding to the Labour Force Survey. Previously, the weight used to derive estimates of the number of families was determined by nomination of a proxy 'head of household' as representative of the family.
- 49. From April 1991, labour force birthplace data are aggregated according to major groups of the Australian Standard Classification of Countries for Social Statistics (ASCCSS) (1269.0). The ASCCSS was developed by the ABS for use whenever demographic, labour and social statistics are classified by countries.
- 50. The ASCCSS major groups are based on the concept of geographic proximity. They differ from the country groups presented in this publication prior to April 1991. For example, African countries are now covered by 'The Middle East and North Africa' and 'Africa (excluding North Africa)', while Asia has been split into 'Southeast Asia', 'Northeast Asia' and 'Southern Asia'. Data for selected individual countries will continue to be available in this publication and comprehensively on microfiche.
- 51. From August 1994, Labour Force Survey industry data are classified according to the Australian and New Zealand Standard Industrial Classification (ANZSIC), a detailed description of which appears in ANZSIC 1993 (1292.0). Like the previous Australian Standard Industrial Classification (ASIC), ANZSIC classifies businesses according to their economic activities, in a structure consisting of four levels (Division, Sub-division, Group and Class). Labour Force

Birthplace

Industry

Survey data are coded at the Group level, as was the practice under ASIC. To assist users in making comparisons with previously published data, a concordance has been developed which shows for each ASIC Group, the corresponding ANZSIC Group or Groups. The concordance also shows the estimated employment attributable to each ANZSIC Group, compared with ASIC Group data, according to establishment unit employment data on the ABS Business Register at May 1994. Historical estimates of employment by ANZSIC Group have been compiled on the basis of the concordance. For further information about the application of ANZSIC to Labour Force Survey data, see *Information Paper Labour Force Survey: Introduction of ANZSIC for industry data* (Replacement publication) (6259.0) or contact Sylvia Sajler on (06) 252 6525.

Additional data

- 52. Estimates for employed persons classified by industry, occupation and status in employment are available each February, May, August and November, and the following tables are published in issues of this publication for those months:
 - (a) Employed persons:

Industry (original, seasonally adjusted and trend)

Industry and occupation:

- Full-time and part-time workers
- Status in employment
- Age and birthplace
- Hours worked
- Industry divisions and subdivisions
- Occupation major and minor groups
- Industry by occupation.
- (b) Unemployed persons:

Industry and occupation of last full-time job:

- Unemployment rate,

Seasonally adjusted estimates of employed persons by industry have been published in this bulletin since February 1993. Trend estimates have been published since August 1994.

- 54. Current publications produced by the ABS are listed in the *Catalogue of Publications and Products, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
- 55. The ABS can also make available information which is not published. This information is available on a number of media such as floppy disk, microfiche and customised reports. In general, a charge is made for providing unpublished information. Inquiries should be made to Sylvia Sajler on Canberra (06) 252 6525 or any ABS office.
- 56. Estimates have been rounded and discrepancies may occur between sums of the component items and totals.

TECHNICAL NOTES

A new sample for the LFS was phased in over the period September to December 1992. For information about the sample design see *Information Paper: Labour Force Survey Sample Design* (6269.0).

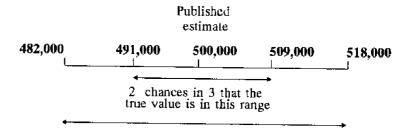

- 2. The labour force estimates are derived from the population survey by use of a complex ratio estimation procedure, which ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.
- Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error. The sampling error is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them, are subject to sampling variability; that is, they may differ from the estimates that would have been produced if all dwellings had been included in the surveys. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the estimate that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of sampling variability is the relative standard error which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling, and thus avoids the need to refer also to the size of the estimate.
- 4. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in recording and coding data, and errors made in processing the data. Inaccuracies of this kind are referred to as the *non-sampling error* and they may occur in any enumeration, whether it be a full count or a sample. It is not possible to quantify non-sampling error, but every effort is made to reduce it to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures. For the examples in paragraphs 9 and 11, it is assumed to be zero. In practice, the potential for non-sampling error adds to the uncertainty of the estimates caused by sampling variability.
- 5. Space does not allow for the separate indication of the standard errors of all estimates in this publication. Standard errors of estimates for the latest month and of estimates of movements since the previous month are shown in Table 1. Standard errors of other estimates and other monthly movements should be determined by using Tables A and B.
- 6. The size of the standard error increases with the level of the estimate, so that the larger the estimate the larger is the standard error. However, it should be noted that the larger the sample estimate the smaller will be the standard error in percentage terms. Thus, larger sample estimates will be relatively more reliable than smaller estimates.
- 7. As the standard errors in Table A show, the smaller the estimate the higher is the relative standard error. Very small estimates are subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, only estimates with relative standard errors of 25 per cent or less, and percentages

Estimation procedure

Reliability of the estimates

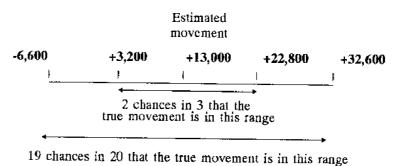

based on such estimates, are considered sufficiently reliable for most purposes. However, estimates and percentages with larger relative standard errors have been included and are preceded by an asterisk (e.g. *3.4) to indicate they are subject to high standard errors and should be used with caution.

- 8. The movement in the level of an estimate is also subject to sampling variability. The standard error of the movement depends on the levels of the estimates from which the movement is obtained rather than the size of the movement. An indication of the magnitude of standard errors of monthly movements is given in Table B. The estimates of standard error of monthly movements apply only to estimates of movements between two consecutive months. Movements between corresponding months of consecutive quarters (quarterly movements), corresponding months of consecutive years (annual movements) and other non-consecutive months, will generally be subject to somewhat greater sampling variability than is indicated in Table B. Standard errors of quarterly movements can be obtained by multiplying the figures in Table A by 1.11. Standard errors of all annual movements can be obtained by multiplying the figures in Table A by 1.3. When using Table A or Table B to calculate standard errors of movements, refer to the larger of the two estimates from which the movement is derived.
- Examples of the calculation and use of standard errors are given below:
- (a) Consider an estimate for Australia of 500,000 employed persons aged 15-19. By referring to Table Λ, in the row for an estimate of 500,000 and the column for Australia, a standard error of 9,000 is obtained. There are about two chances in three that the true value (the number that would have been obtained if the whole population had been included in the survey) is within the range 491,000 to 509,000. There are about nineteen chances in twenty that the true value is in the range 482,000 to 518,000.

19 chances in 20 that the true value is in this range

(b) Consider estimates for females employed part time in Australia of 1,387,000 in one month and 1,400,000 in the next month. This represents an upward movement of 13,000. By referring to Table B for the larger estimate of 1,400,000, a movement standard error of 9,800 is obtained (after applying linear interpolation and rounding). Therefore, there are about two chances in three that the true movement is in the range +3,200 to +22,800 and about nineteen chances in twenty that the true movement is in the range -6,600 to +32,600.

10. The relative standard errors of estimates of aggregate hours worked, average hours worked, average duration of unemployment, and median duration of unemployment are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see Table A) and then multiplying the figure so obtained by the following relevant factors:

Aggregate hours worked: 1.2 Average hours worked: 0.7 Average duration of unemployment: 1.3 Median duration of unemployment: 2.0

The levels at which these and other labour force estimates have a relative standard error of 25 per cent are shown in Table C.

- 11. The following is an example of the calculation of standard errors where the use of a factor is required:
- (a) Consider a median duration of unemployment for Australia of 30 weeks, with an estimate of 1,000,000 persons unemployed. Table A gives the standard error as 11,800 which is 1.2 per cent as a relative standard error. The factor of 2.0 (see paragraph 10) is applied to the relative standard error of 1.2 per cent to obtain 2.4 per cent. Therefore the standard error for the median duration of unemployment is 2.4 per cent of 30 weeks, i.e about 1 week. So there are two chances in three that the median duration of unemployment is between 29 and 31 weeks, and about nineteen chances in twenty that it is between 28 and 32 weeks.
- 12. Proportions and percentages (for example, unemployment rates) formed from the ratio of two estimates are also subject to sampling error. The size of the error depends on the accuracy of both the numerator and denominator. The formula for the relative standard error (RSE) of a proportion or percentage is given below:

RSE
$$(x/y) = \sqrt{[RSE (x)]^2 - [RSE (y)]^2}$$

13. Standard errors contained in Tables A and B are designed to provide an average standard error applicable for all monthly labour force survey estimates. Analysis of the standard errors applicable to particular survey estimates has shown that the standard errors of estimates of employment are generally equivalent to those shown in Tables A and B, while standard errors for estimates of unemployment and persons not in the labour force are approximately 3 per cent and 11 per cent respectively higher than those shown in the tables. Standard errors for capital cities are approximately the same as those for corresponding States. Standard errors of estimates of numbers of families are approximately the same as those for numbers of persons. Standard errors of estimates of persons born in Australia are approximately the same as those shown in Tables A and B. For aggregate estimates of persons born outside Australia the standard errors are about 14 per cent higher. The standard errors vary for individual countries of birth, but are on average about 7 per cent higher.

GLOSSARY

Actively looking for work

Includes writing, telephoning or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service noticeboards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency; advertising or tendering for work; and contacting friends or relatives.

Aggregate hours worked

The total number of hours a group of employed persons has actually worked during the reference week, not necessarily hours paid for.

Attending school

Persons aged 15 to 19 who, during the reference week, were enrolled full time at secondary or high schools.

Attending tertiary educational institution full time

Persons aged 15 to 24 who, during the reference week, were enrolled full time at a TAFE college, university, or other tertiary educational institution.

Average duration of unemployment

For a group of unemployed persons, the aggregate duration of unemployment divided by the number of persons in the group.

Average hours worked

Aggregate hours worked by a group divided by the number of persons in that group.

Birthplace

From April 1991, classified according to the Australian Standard Classification of Countries for Social Statistics (ASCCSS) (1269.0).

Couple families

Families in which there are two married persons and these persons are husband and wife.

Dependants

All family members under 15 years of age; all sons or daughters aged 15 to 19 attending school or aged 15 to 24 attending a tertiary educational institution full time (except those classified as husbands, wives or lone parents).

Dependent student

In couple or one parent families, sons or daughters aged 15 to 19 attending school or aged 15 to 24 attending a tertiary educational institution full time (except those classified as husbands, wives or lone parents).

Duration of unemployment

The period from the time a person began looking for work or was stood down, to the end of the reference week. Thus the survey measures current (and continuing) periods of unemployment rather than completed spells. For persons who may have begun looking for work while still employed, the duration of unemployment is defined as the period from the time the person last worked full time for two weeks or more to the end of the reference week.

Employed

Persons aged 15 and over who, during the reference week:

- (a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (comprising employees, employers and own account workers); or
- (b) worked for one hour or more without pay in a family business or on a farm (i.e. contributing family workers); or
- (c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the reference week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the reference week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or
- (d) were employers, own account workers or contributing family workers who had a job, business or farm, but were not at work.

Employment/population ratio

For any group, the number of employed persons expressed as a percentage of the civilian population aged 15 and over in the same group.

Family

Two or more related persons (relationship includes relationships by blood, marriage or adoption) usually resident in the same household at the time of the survey. A family comprises a married couple or a family head as defined, together with any persons having any of the following relationships to them:

- (a) sons or daughters of any age, if not married and with no children of their own present;
- (b) other relatives if not accompanied by a spouse, sons or daughters, or parents of their own; or
- (c) any children under 15 years of age who do not have a parent present.
- (a) Any person without a spouse present, but with a son or daughter aged under 15 present; or
- (b) persons without a spouse present, without a son or daughter aged under 15 present, but with a son or daughter aged 15 or over present (provided that the son or daughter has no spouse, son or daughter of his/her own present); or
- (c) where a family has no person falling into either of these categories, the family head is generally defined to be the cldest person in the family.

No family head is determined for a couple family.

Unemployed persons who have previously worked full time for two weeks or more but not in the past two years.

Employed persons who usually worked 35 hours or more a week (in all jobs) and others who, although usually working less than 35 hours a week, worked 35 hours or more during the reference week.

A group of one or more persons in a private dwelling who consider themselves to be separate from other persons (if any) in the dwelling, and who make regular provision to take meals separately from other persons, i.e. at different times or in different rooms. Lodgers who receive accommodation but not meals are treated as separate households. Boarders who receive both accommodation and meals are not treated as separate households. A household may consist of any number of families and non-family members.

From August 1994, classified according to the Australian and New Zealand Standard Industrial Classification (ANZSIC) 1993 (1292.0).

Unemployed persons who have worked full time for two weeks or more in the past two years and *left that job voluntarily*, that is, because of unsatisfactory work arrangements/pay/hours; the job was seasonal, temporary or a holiday job and they left that job to return to studies; their last job was running their own business and they closed down or sold that business for reasons other than financial difficulties; or any other reasons,

Unemployed persons who have worked full time for two weeks or more in the past two years and *left that job involuntarily*, that is: were laid off or retrenched from that job; left that job because of their own ill-health or injury; the job was seasonal, temporary or a holiday job and they did not leave that job to return to studies; or their last job was running their own business and the business closed down because of financial difficulties.

For any group, persons who were employed or unemployed, as defined.

A classification of the civilian population aged 15 and over into employed, unemployed or not in the labour force, as defined. The definitions conform closely to the international standard definitions adopted by the International Conferences of Labour Statisticians.

The head of a one parent family.

A person who is the sole member of a household.

Family head

Former workers

Full-time workers

Household

Industry

Job leavers

Job losers

Labour force

Labour force status

Lone parent

Lone person

Long-term unemployed

Persons unemployed for a period of 52 weeks or more.

Main English Speaking Countries

The United Kingdom, Ireland, South Africa, Canada, the United States of America and New Zealand.

Marital status

Persons are classified as married (husband and wife) if they are reported as being married (including de facto) and their spouse was a usual resident of the household at the time of the survey. The not-married category comprises persons who have never married, or are separated, widowed or divorced, as well as those who, although reported as being married, did not have a spouse who usually lived in the household.

Median duration of unemployment

The duration which divides unemployed persons into two equal groups, one comprising persons whose duration of unemployment is above the median and the other, persons whose duration is below it.

Non-dependent child

In couple or one parent families, sons or daughters aged 15 and over not attending school or a tertiary educational institution full time (except those classified as husbands, wives or lone parents).

Non-family member

A person who is not related to any other member of the household in which they are living.

Not in the labour force

Persons who were not in the categories employed or unemployed, as defined. They include persons who were keeping house (unpaid), retired, voluntarily inactive, permanently unable to work, persons in institutions (hospitals, gaois, sanatoriums, etc.), trainee teachers, members of contemplative religious orders, and persons whose only activity during the reference week was jury service or unpaid voluntary work for a charitable organisation.

Occupation

Classified according to the Australian Standard Classification of Occupations (ASCO) 1986 (1222.0).

One parent families

Families in which there is a family head together with at least one son or daughter of his/her own.

Other families

Families which are not couple families or one parent families, as defined. They include families in which there is no parent, for example a family head living with a brother or sister.

Participation rate

For any group, the labour force expressed as a percentage of the civilian population aged 15 and over in the same group. Participation rates for persons classified by birthplace are calculated using population estimates which exclude those in institutions. Participation rates for persons classified by school or tertiary educational institution attendance are calculated using population estimates which include those in institutions.

Part-time workers

Employed persons who usually worked less than 35 hours a week and who did so during the reference week.

Seasonally adjusted series

 Λ time series of estimates with the estimated effects of normal seasonal variation removed. See paragraphs 28 and 29 of the Explanatory Notes for more detail.

State capital cities

The areas determining the six State capital cities are the Statistical Divisions for those capital cities defined in the Australian Standard Geographical Classification (ASGC) Manual, Edition 2.1 (1216.0).

Status in employment

Employed persons classified by whether they were employers, own account workers, employees, or contributing family workers.

Trend series

A smoothed seasonally adjusted series of estimates. See paragraphs 30 to 33 of the Explanatory Notes for more detail.

Unemployed

Persons aged 15 and over who were not employed during the reference week, and:

- (a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week and:
 - (i) were available for work in the reference week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the reference week); or
 - (ii) were waiting to start a new job within four weeks from the end of the reference week and would have started in the reference week if the job had been available then; or
- (b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the reference week (including the whole of the reference week) for reasons other than bad weather or plant breakdown.

Unemployed looking for first full-time job

Unemployed looking for first job

Unemployed looking for full-time work

Unemployed looking for part-time work

Unemployed persons classified by industry and occupation

Unemployment rate

Unemployed persons looking for full-time work who had never worked full time for two weeks or more.

Unemployed persons who had never worked full time for two weeks or more.

Unemployed persons who actively looked for full-time work or were to resume a full-time job, from which they had been stood down.

Unemployed persons who had actively looked for part-time work only, or were to resume a part-time job, from which they had been stood down.

Unemployed persons who had worked full time for two weeks or more in the last two years are classified according to the industry and occupation of their most recent full-time job.

For any group, the number of unemployed persons expressed as a percentage of the labour force in the same group.

SECTION B: SUPPLEMENTARY DATA

LABOUR FORCE EXPERIENCE, FEBRUARY 1995

SUPPLEMENTARY AND SPECIAL SURVEYS

The supplementary and special surveys collect data on particular aspects of the labour force. The following is a historical list of supplementary and special labour force surveys. Statistical tables published in these bulletins are available as a Publication or a Standard Data Service, available by subscription or on request. Inquiries should be made to the contact in the Phone Inquiries box on the Contents page. It may be possible to order Unit Record Tapes on the following supplementary and special surveys by contacting the ABS (see below for contact numbers).

Labour Force Experience, February 1995

Labour Force Experience, February 1995

A survey of labour force experience was conducted among persons aged 15 to 69 years in February 1995 as a supplement to the monthly Labour Force Survey. Labour force experience can be described in terms of labour force activities undertaken by persons in a 12 month period, namely working and looking for work.

The survey measured the number of whole weeks persons were engaged in these labour force activities during the year, the number of employers or businesses persons had during the year, the number of spells of looking for work during the year and the main activity of persons when not in the labour force.

In February 1995, Australia's civilian population included 12,444,900 persons aged 15 to 69 years. Of these persons, during the 12 months ending February 1995 —

- 8,923,100 (81 per cent of males and 63 per cent of females) worked at some time during the year;
- 1,968,400 (18 per cent of males and 14 per cent of females) looked for work at some time during the year; and
- 5,553,300 (32 per cent of males and 57 per cent of females) were not in the labour force at some time during the year.

The proportion of the population aged 15 to 69 years who worked at some time during the year was 72 per cent. This result was the highest recorded since March 1991.

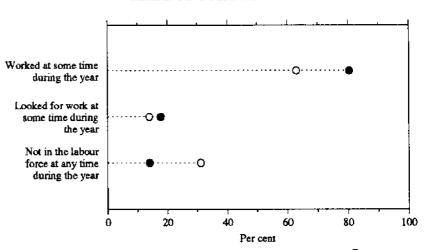

It is possible for a person to be in one or more of the above categories over the course of a 12 month period. Specifically, there were 6,107,500 (49%) persons who spent the whole year engaged in just one labour force activity and 2,803,800 (23%) persons who spent no time in the labour force. A further 3,533,600 (28%) persons either spent time in more than one labour force activity during the year or only part of the year in the labour force (Diagram 2, Table 2).

Participation in the labour force

An estimated 9,641,100 persons aged 15 to 69 years were in the labour force, that is, either worked or looked for work at some time during the 12 months ending February 1995 (Diagram 2, Table 2).

The participation rate of males was 86 per cent in the year to February 1995, the highest rate recorded since March 1991. While the participation rate for females remained steady at 67 per cent from March 1990 through to March 1993, the rate increased to 69 per cent for the year to February 1995 (Table 1).

Overview

Introduction

The Alaka Alamata Abada bahar a Para

DIAGRAM 2. ALL PERSONS: LABOUR FORCE EXPERIENCE DURING THE YEAR ENDING FEBRUARY 1995

Source: Table 2

Labour force experience

An estimated 6,891,600 persons were in the labour force for the whole year. Of this group, 5,812,000 persons worked 52 weeks; 784,100 persons spent time in both labour force activities; and 295,500 persons looked for work for the whole 12 months.

There were 2,749,500 persons who were in the labour force for only part of the year, that is, they spent less than 52 weeks in the labour force. Of these people, 1,860,700 worked for part of the year but did not look for work at other times; 466,300 worked for part of the year and also spent some of the balance looking for work; and 422,400 persons looked for work but did not work at all during the year.

The proportion of males spending the whole year in the labour force has fallen from 70 per cent in March 1992 to 68 per cent in February 1995. A further 18 per cent of males spent less than 52 weeks in the labour force during the year (Table 1).

For females, 38 per cent of those with children under 15 spent the whole year in the labour force and a further 32 per cent spent between one and 51 weeks in the labour force. In comparison, those females without children under 15 had a greater tendency to spend either all or no time in the labour force with 45 per cent in the labour force for 52 weeks and a further 23 per cent spending between one and 51 weeks in the labour force (Table 2).

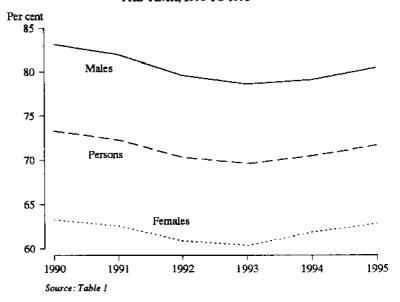

Persons who worked at some time during the year

An estimated 8,923,100 persons worked at some time during the year, comprising 5,011,900 males and 3,911,200 females.

Of the 5,011,900 males who worked at some time during the year, 82 per cent worked all weeks full time, 10 per cent worked all weeks part time and 8 per cent worked a combination of full time and part time.

Of the 1,297,900 females with children under 15 who worked at some time during the year, 36 per cent worked all weeks full time, 53 per cent worked all weeks part time and 11 per cent worked a combination of full time and part time. By comparison, of the 2,613,300 females without children under 15 who worked at some time during the year, 56 per cent worked all weeks full time, 33 per cent worked all weeks part time and 11 per cent worked a combination of full time and part time (Table 2).

DIAGRAM 3. PERSONS WHO WORKED AT SOME TIME DURING THE YEAR, 1996 TO 1995

Persons who looked for work at some time during the year During the year ending February 1995, 1,968,400 persons looked for work at some time comprising 1,105,000 males and 863,400 females.

While the proportion of males who looked for work at some time during the year steadily increased from 13 per cent in March 1990 to 20 per cent in March 1993, it has fallen over the last 2 years to 18 per cent in February 1995. The proportion of females who looked for work at some time during the year has increased from 12 per cent in March 1990 to 14 per cent in February 1995 (Table 1, Diagram 4).

Of the 1,968,400 persons who looked for work at some time during the year -

- 17 per cent of males and 13 per cent of females looked for the whole 52 weeks; and
- the majority of males (73%) and females (75%) had one spell looking for work (Table 2).

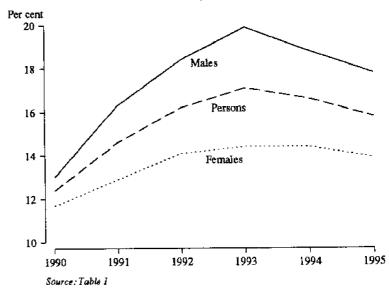

DIAGRAM 4. PERSONS WHO LOOKED FOR WORK AT SOME TIME DURING THE YEAR, 1990 TO 1995

Persons who were not in the labour force at some time during the year The number of persons not in the labour force at some time during the year ending February 1995 was 5,553,300 persons. Of these people, 2,803,800 (51%) were not in the labour force at any time during the year.

For males, the most commonly reported main activity while not in the labour force was "Attended an educational institution" (27%), followed by "Retired or voluntarily inactive" (26%).

For females the most commonly reported main activity while not in the labour force was "Home duties/childcare" (59%), followed by "Attended an educational institution" (15%) (Table 4).

SUPPLEMENTARY SURVEYS: EXPLANATORY NOTES

Introduction

This publication contains some results of the 'Labour Force Experience' supplementary survey run in association with the February 1995 Labour Force Survey conducted throughout Australia.

- 2. Those respondents to the Labour Force Survey who fell within the scope of the supplementary survey were asked additional questions. Persons aged 15 to 69 years were asked the length of time they worked or looked for work, the number of spells during which they looked for work and other aspects of labour force experience for the 52 weeks up to the end of the week before the interview.
- 3. The scope of this supplementary survey was the same as that used for the Labour Force Survey except that it was restricted to persons aged 15 to 69 years. Visitors to private dwellings, students who were boarding at school, some patients in hospitals and sanatoriums and inmates of reformatories, gaols, etc. have also been excluded.
- 4. In the tables, 'All Persons' refers to all persons within the scope of the survey.
- 5. The coverage rules for this supplementary survey were the same as those used for the Labour Force Survey. These rules aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection.
- 6. Definitions of labour force and demographic classifications appearing in this publication are given in Section A. Other definitions specific to the supplementary survey are given in the Glossary in this section.
- 7. Labour force experience characteristics relate to the 52 weeks up to the end of the week before the interview. Unless otherwise stated, all other characteristics referenced in these tables relate to the week before the interview.
- 8. The estimates relate to persons covered by the survey in February 1995. Because of emigration, deaths, etc., not all persons with labour force experience during the period were covered. Labour force experience may relate to experience outside Australia.
- 9. Due to differences in the method of estimation used in this supplementary survey and that used in the Labour Force Survey, there are some small variations between estimates in these tables and those in the corresponding issue of *The Labour Force*, *Australia* (6203.0).
- 10. The estimates in these tables refer to information collected in the survey month and, due to seasonal factors, may not be representative of other months of the year.
- 11. Results of similar surveys, conducted in February 1969, 1973, 1975, 1976, 1977, annually from February 1979 to February 1989, and annually from March 1990 to March 1994, have been given in previous issues of the discontinued publication Labour Force Experience, Australia (6206.0).
- 12. Statistical tables formerly published in these bulletins are now available as a Standard Data Service, available on subscription or on request. Inquiries should be made to the contact named in the Inquiries box on the Contents page.
- 13. This survey is scheduled to be conducted next in February 1997, and at two yearly intervals thereafter.
- 14. As well as the statistics included in this publication, the ABS may have other relevant unpublished data available. Inquiries should be made to the contact named in the Inquiries box on the Contents page.

Comparability of series

15. It is impracticable to obtain information relating to a whole year which is strictly comparable with that obtained in the monthly Labour Force Survey for which the reference period is one week. The definitions used in determining the labour force status of persons in the monthly survey depend on a detailed set of questions asked about a person's labour force activity during the reference week. For the survey of labour force experience, a person is assigned to a labour force category on the basis of a more limited set of questions. It is for this reason that the terms worked and looked for work are used in this survey rather than the precisely defined terms employed and unemployed used in the monthly Labour Force Survey.

Discontinuities in the series

16. Results in this publication are from the latest survey conducted in the month of February 1995. Prior survey results also included in these tables are for those surveys conducted in March 1990 to March 1994. Therefore, the estimates for the surveys conducted in the month of March are not strictly comparable with those conducted in the month of February.

Survey sample redesign

17. In previous years this supplementary survey has been conducted on either 50 per cent, 75 per cent, or the full sample of the dwellings selected in the Labour Force Survey. Since July 1994, the sample size for all supplementary surveys has been reduced to seven-eighths of the full Labour Force Survey sample. As a result the standard errors for this survey differ from those applicable to previous surveys.

Reliability of the estimates

- 18. Estimates in this publication are subject to sampling and non-sampling errors. For information about the standard errors appropriate to the supplementary survey, inquiries should be made to the contact officer in the Inquiries box at the front of this publication.
- 19. Because estimates have been rounded, discrepancies may occur between sums of the component items and totals.
 - subject to sampling variability too high for most practical uses.

SUPPLEMENTARY SURVEYS: GLOSSARY

All persons Civilian population aged 15-69 years. See paragraph 3 of the Explanatory Notes in this section for details of exclusions. Full-time status of weeks worked During any week of the reference period, if a person perceived that they worked during the year full time they were classified as working full time in that week.
